

Beehives

Honey is not just a “sweet addition” to the work of bees. A honey bee (*Apis mellifera*) is the only one that produces honey and performs over 88% of all pollinator work. The lack of these insects can result in a plant yield reduction of up to 80%, which, in turn may lead to a lack of food also for us! Therefore, **wherever possible, we place beehives on our buildings.**
